

A Letter from the Aerotoxic Association Patron

Mrs Elizabeth Sigmund Hon DSc.

Recent scientific evidence has been published both in the UK and the US which proves that even low levels of exposure to organophosphates can cause instant or delayed nervous system damage.

This makes it imperative that people who believe that they have been affected by such exposure come forward and join the Aerotoxic Association to provide growing evidence of health damage.

Such people may have been exposed by inhaling fumes while working as airline crew, or while working in agriculture or horticulture or they may have been involved in the first Gulf war.

This is extremely important as the Aerotoxic Association is opening for membership on 17 September 2007.
